

Methodology

CARE Ratings South Africa (Pty) Limited (CARE SA) rating methodology for NBFCs is applied to companies registered as NBFIs. This methodology highlights the parameters considered by CARE SA for a standalone assessment of NBFCs. The final rating also factors in any additional notching that is applicable for parent/promoter group linkages which is done as per CARE SA's methodology of 'Factoring Linkages in Ratings'. The key parameters considered for a standalone assessment of NBFCs are depicted below.

The above-mentioned parameters are elaborated in the sections below.

1. Business Mix and Growth Trend

NBFCs lend to various retail loan segments such as personal loans, gold loans, microfinance, consumer loans, vehicle finance, housing loans, small business loans and wholesale loan segments like corporate loans, infrastructure loans, real estate loans, structured credit, etc. The business mix through different loan products offered by the NBFC is the key determinant of the risk and returns for the entity in conjunction with the operating environment. The prevailing economic scenario for the asset classes being financed has significant impact on the growth potential and asset quality of the NBFC.

In case of retail NBFCs in particular, products offered are assessed on key parameters such as loan tenor, ticket size, yields and loan to value. Each parameter is seen in relation to the relevant asset class. For example, riskier asset classes like unsecured MSME loans tend to have higher yields.

The proportion of unsecured loans in the outstanding advances is also considered along with the borrower segments and geographical diversification of the portfolio. Higher proportion of unsecured funding to the borrowers with marginal credit profile increases the vulnerability of the NBFC to change in business cycles. A higher geographical diversification is often viewed favorably as it limits the exposure to event-based risks in specific geographies, particularly in asset classes such as microfinance loans.

In case of wholesale NBFCs, the sectors financed and major exposures are seen.

CARE SA also looks at the trend in disbursements made by the NBFC in light of the economic scenario for the asset classes in which it operates. Inability to scale up operations may impact the future sustainability of the NBFC. The growth rate of disbursements also indicates the level of seasoning of the portfolio.

2. Capital and Leverage

The level of capital determines the ability of the NBFC to absorb losses arising out of its business activities and provides cushion to its lenders against such losses. Capital Adequacy Ratio (CAR) is a measure of the degree to which the company's capital is available to absorb unexpected loss; high CAR also indicates the ability of the company to undertake additional business.

While NBFCs are required to comply with a minimum CAR stipulated by the SARB, CARE SA looks at the management's approach towards maintaining a cushion over regulatory CAR in light of the asset-class mix of its lending portfolio along with the corresponding trend in delinquencies and portfolio concentration. Sensitivity analysis on the CAR of the NBFC is also carried out if required for various scenarios like increase in credit cost which may affect the CAR. A higher Tier I CAR is viewed favorably as it reflects the core capital of the NBFC.

CARE SA also looks at the debt equity ratio of the NBFC as a leverage measure. NBFC's leverage is a function of its business mix, asset-class-wise growth potential, delinquency trends and portfolio concentration among other factors. While relatively higher leverage is acceptable for granular and stable asset classes like retail home loans, a lower leverage may be warranted for portfolios which are either more concentrated (e.g., Corporate or builder loans) or the ones which exhibit higher risk of delinquencies like Micro Finance loans, unsecured SME loans, etc. CARE SA looks at leverage in light of these underlying factors along with any synergies derived from parentage or group linkages. In case of significant exposure to group entities, adjusted standalone leverage is calculated by reducing the amount of such exposure from the tangible networth of the entity.

Demonstrated ability of an NBFC to raise adequate equity capital from varied set of investors is viewed favourably. Similarly, demonstration of support to an NBFC through equity infusion by a strong promoter group or parent company is also viewed favourably. For NBFCs resorting to securitization of their assets, CARE SA assesses leverage, asset quality and profitability on the basis of assets under management (AUM) by treating such off-balance sheet assets as on-balance sheet.

CARE SA follows a consolidated approach when the group companies are engaged in similar business (lending) but operate through different entities due to different asset class and corresponding regulatory compliances to be followed. In such case, CARE SA considers the capital adequacy of the holding company at standalone level as per regulatory requirements. Furthermore, overall gearing and Net NPA / Net worth ratios are analyzed to ascertain whether the entity has sufficient level of capitalization at the consolidated level.

3. Asset Quality

Asset quality is one the most critical parameters while assessing NBFCs. Asset quality is dependent on the asset class in which an NBFC operates. The business of NBFCs is to assume credit risk and earn a profit after factoring in the expected level of credit costs. Such credit costs depend on the nature of the asset class and are built into the pricing of loans in that segment. NBFCs strive to keep the credit costs in check within expected levels through efficient risk management, collection and recovery framework. Credit costs are primarily impacted by level of delinquencies observed in the loan portfolio. Worsening of the delinquencies in the loan portfolio not only suppresses profitability through higher credit costs, but also puts pressure on capital cushion available to absorb losses and can lead to restricted access to funds from the market resulting in subdued growth prospects. Given that NBFCs primarily are dependent on wholesale funding, worsening of key parameter like Gross NPA level can quickly and severely impact access to funds which in turn can threaten the viability of the operations of an NBFC.

The overall asset quality of NBFCs is assessed by evaluating the asset-class-wise exposures and Days Past Due (DPD) bucketing of the outstanding advances. In case of wholesale assets, large vulnerable exposures are evaluated since the same can impact capital position in case of stress. In case of retail loan book (vehicle, housing, SME, etc.), the empirical trend in delinquencies exhibited for the entity is examined for each retail asset-class and the same is also compared with the industry peers.

The historical collection efficiency and the company's experience of loan losses and write-off/provisions are studied. The portfolio diversification and exposure to vulnerable sectors is evaluated to assess the level of vulnerable assets. In case of high-ticket size loans like corporate or real estate loans, the top exposures are seen. The proportion of such wholesale loans in the overall portfolio is considered. Furthermore, such exposures are also viewed in relation to the company's net worth so as to assess the extent of concentration and vulnerability to any of the large exposures turning delinquent. The asset quality of individual product classes is viewed in tandem with the seasoning of the loan book. NBFCs with short track record would have seen limited seasoning of its portfolio so as to make any meaningful assessment of its steady state asset quality. NBFCs which report an aggressive growth rate of loan book year-on-year also have a large part of their loan book remaining unseasoned and hence assessment of its steady state asset quality becomes difficult. The gross NPA is looked at on a lagged basis to negate the effect of growth on the asset quality parameters.

Exposure to group entities, in the form of lending or investment, is examined to understand the loss potential of such assets. The same is subject to stress test in the same way as any other asset and the impact is evaluated on level of NPA and provisioning needs.

4. Profitability

CARE SA analyses the composition of income of the company by segregating it into fee-based and fund-based activities. Core earnings are also identified by excluding non-recurring income from the total income. Each business area that contributes to the core earnings is assessed for risks as well as for its earnings prospects and growth rate. It is examined whether the interest yields are commensurate with the asset class and nature of operations.

Profitable operations are essential for NBFCs to operate as a going concern and generate internal capital which can be deployed for future growth. Historical trend in declaring dividend and the dividend policy is studied as this would determine the extent of profits retained and available for plough back in the business. Profitability is gauged through trend in return on total assets (ROTA) and return on net worth (RONW). The contributing factors to NBFC's profitability are assessed to study the overall impact. The ROTA chain (both on balance sheet and adjusted for off-book portfolio) is analysed through interest spread, net interest margin, other income, operating expenses and credit costs.

Interest spread and Net interest margin are determined by average yield earned on assets and average cost of funds raised by an NBFC. While interest rates charged on loans is a function of the asset class and NBFC's competitive positioning, interest expense is driven by the liability profile and borrowing mix of a NBFC. Apart from interest income, many NBFCs also have a fee income component which adds to the total income and is intended to cover up for operating expenses.

Operating expenses (opex) are dependent upon the nature of operations and business model deployed by a NBFC. Retail lending is generally more opex intensive as it involves setting up branches and deploying manpower for various functions like origination, underwriting and collections. On the contrary, opex is relatively low for wholesale lending operations. Within retail lending also, some products require higher opex vis-à-vis others. The trend in the Pre-Provisioning Operating Profit earned by the NBFC is observed. Ratios, such as, Operating Expenses/Average Total Assets and Cost to Income (net of Interest expenses) are looked at in order to understand its impact on the overall profitability of a NBFC.

Finally, the credit cost is driven by provisioning and write-offs made by the NBFC and is dependent on the asset quality of the underlying portfolio. The overall impact of the above factors on the RoTA is studied to gain an understanding about profitability. Furthermore, the RoNW is also looked at and is impacted by the extent of leverage of an NBFC.

5. Liquidity

Lack of liquidity can lead an NBFC towards failure, while, strong liquidity can help even an otherwise weak company to remain adequately funded during difficult times. CARE SA evaluates the internal and external sources of funds to meet the company's requirements. The liquidity risk is evaluated by examining the stated liquidity policy, the assets liabilities maturity (ALM) profile, collection efficiency, deposit renewal rates (based on empirical evidence) and proportion of liquid assets in relation to its total borrowings. The contractual liabilities like commercial papers, short-term loans are not assumed to be rolled over. The short-term external funding sources in the form of unutilized lines of credit available from banks, etc., along with direct and other investments if any are important sources of reserve liquidity. While considering unutilized bank lines as back up, the availability of such lines is also assessed in a scenario of change in sentiments towards the sector or the promoters or due to overall tight liquidity scenario in the system.

CARE SA looks at the debt repayment obligations of NBFC over the next 12 months and the extent to which cash and liquid assets are available to cover it. Further, the scheduled inflows from credit assets (adjusted for collection efficiency) over the next 12 months are compared with the 12-month debt obligations to arrive at a cover based on such asset inflows. For NBFCs running a negative ALM mismatch in 1-year bucket, such cover will tend to be below 100%, thereby increasing the refinancing risk. A stress test on the inflows is also done to evaluate the impact on liquidity in case the contracted inflows are lower than expected.

In case there are significant inflows considered from group entities, the possibility of rescheduling of such inflows and the liquidity profile of the borrower is evaluated considering that the lender may require the continue to support the group entity. This may result in the cash flow being delayed, impacting the ALM profile of the NBFC.

From liquidity perspective, NBFCs adopting a liability maturity profile which is consistent with the asset maturity are viewed favourably. Any negative mismatch without proper backup is viewed as a risk. In case of entities belonging to large groups, demonstrated support from group will be considered as backup.

In case of presence of any acceleration clauses embedded in borrowing agreements with lenders/investors which are linked to downgrade in external credit ratings, the ALM profile of an NBFC can be severely distressed in case of such rating downgrades. CARE SA, in its assessment of liquidity, does not take into account the presence of such rating-linked acceleration clauses. However, NBFCs have witnessed severe liquidity mismatches in such events which have translated into sharp deterioration in their liquidity profile upon trigger of such clauses. In such cases, the ratings will see a much sharper migration than otherwise.

6. Resource Profile

Resource base of the NBFC is analysed in terms of cost and composition. Proportion of deposits/ loans/ bonds in funding mix is examined along with the investor type. CARE SA also looks at the trend of raising resources through securitisation. The ability to diversify funding sources is a key factor in rating of NBFCs. Generally, the entities having major funding from different segments of the capital markets and overseas markets are considered having better diversification of resources. Average as well as incremental cost of funds are examined in the context of prevailing interest rate regime. The ability of the company to raise additional resources at competitive rates is considered. Stability of sources of finance and trend in funding mix is also an important indicator of the resource raising ability of the NBFC. The managements' strategy for funding is examined in light of its appropriateness with its growth strategy, the assets class, maintaining buffer / head room for raising capital in the form of securitisation, tier II capital, etc. The funding mix should be prudent to the nature of assets.

7. Management & Systems

The track record of the promoters, experience of the management team and the organizational structure of the company are considered. If the shareholding of the company is fragmented without a clear majority, it would entail further analysis on commitment of the individual shareholders to support the company.

The company's strategic objectives and initiatives in the context of resources available, its ability to identify opportunities and track record in managing stress situations are taken as indicators of managerial competence. Market reputation of the promoters of an NBFC is also a key factor in its ability to access various funding sources at competitive rates. Adequacy of the information systems used by the management is evaluated. CARE SA focuses on modern practices and systems, level of technology deployed, capabilities of senior management and personnel policies. In case of shared resources by group companies, the strength and quality of group cos/businesses is considered while assessing the management strength. Furthermore, the proven capabilities of the NBFC in its asset class and peer group is also examined.

The management's stance (both stated and exhibited) on risk and risk management framework is considered. Credit risk management is evaluated by assessing the appraisal, monitoring and recovery systems and prudential lending norms of the company. The company's policy on liquidity risk and interest rate risk is considered. CARE SA looks at the track record of the company in complying with regulatory requirements of SARB.

8. Size, Vintage & Market Presence

Size is reflected through the level of capital and level of total assets of a NBFC. Large size would generally be associated with long operating track record, significant market presence, demonstrated ability to raise resource from varied source and asset quality and profitability performance established over time through the cycles. Management's strategy for profitable growth and their ability to navigate through difficult business environment is better assessed for an NBFC which has a long track record of operations and has grown to a relatively large size. While large size by itself is not a direct determinant of ratings, it does provide an indication of the competitive strength and financial flexibility of a NBFC. Large NBFCs can have a diversified portfolio or could be a sizeable player in a single asset class. In either case, the ability to compete and generate risk-adjusted returns over time is better gauged for NBFCs which have a long track record.

CARE SA looks at the market position of the NBFC in individual asset classes and an understanding about its competitive position is developed. Market presence is gauged through the extent of its branch network and geographical spread of operations.

Track record of an NBFC in a given asset class is viewed in order to assess the experience of the company in operating in a given asset class and its ability to perform steadily through various asset cycles. Portfolio seasoning is critical for assessing the asset quality and profitability parameters on a steady state basis. NBFCs with low vintage or very rapid growth in loan book lack adequate portfolio seasoning and may not reflect steady state asset quality and profitability parameters. Hence, vintage is an important parameter which is considered while assessing critical parameters like asset quality and profitability.

Additional Considerations

- Peer Group Analysis

CARE SA analyzes various financial and non-financial parameters of an NBFC under the overall framework mentioned above. The quantitative factors are evaluated based on the absolute level of numbers and ratios as well as their volatility and trends exhibited over time. CARE SA also compares the company's performance on each of the above-discussed parameters with its peers. Detailed inter-firm analysis is done to determine the relative strengths and weaknesses of the company in its present operating environment and its prospects.

- Market-based Indicators

CARE SA tracks market-based indicators like market capitalization and price/book value for equity-listed NBFCs and compares the same with other listed NBFCs to gain a sense of relative valuation as viewed by equity market. Furthermore, CARE SA also keeps a track of bond yields and spreads of NBFC debt instruments in order to gain an understanding of the markets view about its risk perception. Reasons for sharp changes in yields vis-à-vis similarly rated peers are examined. CARE SA tracks these market indicators so as to understand the market's perception of the value and risk of a NBFC and also to assess the ability of the NBFC to raise resources (equity & debt) at competitive rates to support its business model.

CARE SA looks at various financial ratios while analyzing NBFCs. The description of such ratios can be found in the 'Financial Ratios – Financial Sector' document on CARE SA's website.

Criteria for Rating of Subordinated Debt of NBFCs

CARE SA generally does not differentiate between the rating of senior and subordinated debt of a NBFC. This is on account of the inherent features of the subordinated debt as highlighted below.

- A subordinated debt instrument functions exactly similar to a senior debt instrument in a going concern scenario, i.e., servicing of the same (principal as well as interest) is purely cash-flow driven. The servicing of this instrument is not dependent on presence of profits or maintenance of any minimum capital adequacy parameter by the borrowing entity (unlike the case with other instruments like Upper Tier II or Innovative Perpetual debt issues by the banks).
- Similar to other senior debt instruments, e.g., Non-Convertible Debentures (NCDs), there are no regulatory restrictions with respect to servicing of a subordinated debt instrument in a going concern scenario. These instruments are in nature of medium to long-term instruments and are required to be issued for a minimum five-year tenor to qualify for capital adequacy computation.
- The instrument derives its "subordinated" nature only in the event of liquidation of the issuer, wherein it would rank lower to the claims of other senior creditors. This would affect the loss given default (LGD). However, it would not lead to any difference in the probability of default (PD) between Senior and Subordinated instruments.

The seniority of claim of a Senior Debt over Subordinated Debt comes into picture only in case of a liquidation scenario and on a going concern basis the repayments for both types of debt instruments happens simultaneously and is a matter of liquidity risk. For highly rated NBFCs and HFCs, the liquidity risk is typically minimal. Therefore, the long-term probability of default for Senior and Subordinated debts of a company are similar and the same should reflect in their long-term ratings. However, CARE SA may choose to differentiate between senior and subordinated debt on a case-to-case basis on the basis of credit strength, liquidity profile and any issuer-specific circumstances that may prevail.

About Us:

CARE Ratings South Africa (Pty) Limited (CareEdge South Africa) is incorporated in 2023 to provide credit ratings and related services in South Africa. CARE SA is a wholly owned subsidiary of CARE Ratings Africa (Private) Limited (CareEdge Africa), which is a part of CareEdge Group based in India. In October 2024, CareEdge South Africa has received its license from the Financial Sector Conduct Authority (FSCA) of South Africa, allowing it to conduct and issue credit ratings for corporate bonds, sovereign ratings, financial institutions, structured finance, and green and sustainability-linked bonds.

CARE SA provides Ratings of various instruments such as Bonds, Money Market Instruments, Bank Deposits, Structured Finance and Bank Facilities. CareEdge South Africa also does Issuer Rating (Banks, Corporates, NBDTIs & Insurance companies), ESG Ratings, and Second Party Opinion Reports.

About CareEdge Group

CARE Ratings Ltd. (CareEdge Ratings)

CareEdge Ratings, based out of India and the parent company of the CareEdge group, was incorporated in 1993 and is the one of the largest Credit Rating Agency (CRA) of India and features amongst the top ten credit rating agencies globally. Since inception, CareEdge Ratings has rated USD 2.5 trillion worth of debt and has undertaken over 95,000 rating assignments which includes ratings of large, mid and small corporates as also sub sovereign and state utility companies. Please visit CareEdge website - <https://www.careratings.com>.

CARE Ratings (Africa) Private Limited

In the quest of supporting the development of capital market in African Union, CareEdge Group has set up the first rating agency of Mauritius - CARE Ratings (Africa) Private Limited (CareEdge Africa) in 2014, which is licensed by Financial Services Commission of Mauritius and Capital Markets Authority of Kenya. CareEdge Africa is also recognised by the Bank of Mauritius as External Credit Assessment Institution (ECAI). CareEdge Africa's shareholders are CARE Ratings, India (CARE Ratings), African Development Bank (AfDB), MCB Equity Fund (MEF) and SBM (NFC) Holdings Limited (SNHL). Please visit CARE Ratings Africa website - <https://www.careratingsafrica.com>.
